Section 1: Introduction to Web Development
1. Definition: According to the ebook, what is the simplest definition of a web developer?
They're the builders and maintainers of websites, especially those that we use daily.

2. Specialties: Name the three web development specialties described in the text.
Those would be the front-end, back-end, and the full-stack web developers.

3. Industry Growth: What is the predicted growth percentage for web development jobs through 2024?
It was predicted that it would increase by 27% by the time it hits 2024

4. Benefits: List three advantages of being a web developer mentioned in Chapter 3.
You can work remotely. Completely relevant especially in today's economic crisis, you can work from home and completely disregard the risk of being late and just need to worry about the client. You can use your own skills to build your own websites and web applications, just like how different users use the same application. You can discover niche practices by yourself. You can work independently, freelancers especially benefits with this work practice as they're not tied down within a one company.

5. Responsibilities: Name at least three common tasks or responsibilities of a web Developer.
Build your own websites from scratch
Understand HTML & CMS/Databases, Servers, API's, etc.
Understanding UI/UX

Section 2: Front-End Development
6. HTML Definition: What does the acronym HTML stand for, and what is its primary role in a webpage?
Hyper Text Markup Language or also known as HTML is basically the structure of your website.

7. HTML Tags: Which HTML tag indicates that a document is specifically written in HTML5?
That would be the <html> </html> that it should be written in HTML5.

8. The Header: What is the purpose of the <head> tag in an HTML document?
This is basically the container of information for specific links such as scripts, meta data, and title tags

9. Page Visibility: Which tag contains all the content that will be shown to and read by users?
That would be the <body> </body> tag to output the contents that web developer trying to show to users.

10. CSS Definition: What does CSS stand for, and how does it change the appearance of a Webpage?
CSS or Cascading Style Sheet, it basically the designed to make your website beautiful via implementing padding, margin, colors and shapes of every aspect that the HTML doesn't do.

11. CSS Properties: Name three specific properties that can be adjusted using CSS.
Those would be the margins, height, background-color, text font, and etc.

12. JavaScript Role: How is JavaScript's role on a webpage different from HTML and CSS?
It allows your website to be dynamic, meaning giving it interactivity and allows the experience of the user to run smoothly. This could explain many range of motions such as the drag and drop action and hover events.

13. Interactivity: List two types of "events" JavaScript can implement to add interactivity to a Site.
Click events and hover events are the most common. Drag and drop events can also be implemented.

14. UI vs. UX: Briefly explain the difference between User Interface (UI) and User Experience (UX) design based on the text.
UI focuses on the design of the websites while UX focuses on the experience of the user. Both are crucial as they go hand in hand.

15. Responsive Design: Define "responsive design" and explain why it is considered crucial for modern websites.
Having a responsive design makes it smooth for the user end of the website that encourages them to keep using your website due to the experience alone even if the design is minimalist as long as it's responsive to every click of the users are trying to do.

Section 3: Back-End Development
16. The "Traditional" Back End: What four components typically make up the "traditional" back-end stack?
"Traditional" backend consists of servers, databases, APIs and Operating Systems.

17. Client-Side vs. Server-Side: Where does back-end programming happen compared to front-end programming?
It's whatever the client don't see yet powers everything that client do see in the front end half of the system. Back-end happens on servers, OS and APIs.

18. Programming Styles: Explain the difference between object-oriented and compiled programming languages as mentioned in the text.
Object Oriented Programming is a style of programming that bundles together attributes and functions within a single object whilst Compiled Programming languages affects load time, readability, and processing power.

19. Popular Languages: Which language is cited as being used for the majority of websites?
PHP is cited to be most used in majority of websites followed by Python for processing power and Ruby for faster prototyping.
20. Servers: Why is the server referred to as the "lifeblood" of the network?
These are high-powered computers designed to provide the resources networks need to run which includes: file storage, security and encryption, databases, emails, and web services.

21. Database Function: What is the primary responsibility of a database when a user requests something from a store or website?
They're primary responsibility would be to fetch the query sent by the user in order to fetch the data requested. After doing so the query is then sent back unto the website in order for the user to fully manipulate the data that they had requested.

22. APIs: What is the primary role of an API in server-side software architectures?
They connect softwares, applications, databases, and services seamlessly together.

Section 4: Developer Essentials
23. Data Structures: Why is having a solid understanding of data structures important for solving complex logic problems?
It helps you find ways to crack complex logics and problems as well as increasing your problem solving capabilities.

24. Git & Collaboration: How do concepts like "branching" and "forking" in Git help developers collaborate safely?
This allows you and your collaborators to work on the same project together, even on the same file without the fear of writing over each other.

25. SEO for Developers: Why should a developer care about SEO even if they are not a content creator?
Despite not really designed for developers, it allows us to understand the basics and what should be focused on if ever we're trying to develop a website.
